

## Seasonal seepage investigation on an urbanized reach of the lower Boise River, southwestern Idaho, water year 2010: USGS Scientific Investigations Report 2011-5181

Filesize: 1.87 MB

### ***Reviews***

*The very best publication i actually go through. It can be packed with knowledge and wisdom It is extremely difficult to leave it before concluding, once you begin to read the book.*

*(Rhea Kunze)*

## SEASONAL SEEPAGE INVESTIGATION ON AN URBANIZED REACH OF THE LOWER BOISE RIVER, SOUTHWESTERN IDAHO, WATER YEAR 2010: USGS SCIENTIFIC INVESTIGATIONS REPORT 2011-5181

Bibliogov Mrz 2013, 2013. Taschenbuch. Book Condition: Neu. 246x189x2 mm. This item is printed on demand - Print on Demand Neuware - The U.S. Geological Survey in cooperation with the Idaho Department of Water Resources Treasure Valley Comprehensive Aquifer Management Planning effort investigated seasonal groundwater gains and losses on the Boise River, Idaho, starting in November 2009 through August 2010. The investigation was conducted using seepage runs in 11 subreaches over a 14-mile reach from downstream of the inactive streamgauge, Boise River below Diversion Dam (U.S. Geological Survey station No. 13203510) to the active Boise River at Glenwood Bridge streamgauge (U.S. Geological Survey station No. 13206000). The seepage runs measured mainstem discharge, and significant tributary contributions and diversions along the reach. In addition, an evaluation of the groundwater hydraulic gradient was simultaneously conducted through shallow groundwater mini-piezometers adjacent to the river during February (low stream discharge) and May (high stream discharge) measurement timeframes. November discharge estimates, representative of autumn, had gains and losses that varied by subreach with an overall net gain of  $42 \pm 8$  cubic feet per second (ft<sup>3</sup>/s). This finding compares favorably to a previous U.S. Geological Survey seepage investigation in November 1996 that found a gaining reach with an estimated gain of 52 ft<sup>3</sup>/s. This finding also is supported by a U.S. Geological Survey investigation in the study reach in November 1971 that estimated a gain of 74 ft<sup>3</sup>/s, which largely came from groundwater. The February discharge estimates, representative of winter conditions, showed variability in the reach with a net gain of 52 ft<sup>3</sup>/s with an uncertainty estimate of  $\pm 7$  ft<sup>3</sup>/s, which is consistent with the low stream discharge findings from November 2009. This finding is further supported by the differential hydraulic head measured at transect sites that qualitatively indicated groundwater to surface-water movement with...
